

## COMPACT 50x50 mm LINE SENSOR

- *Line sensor with RS485 serial interface*
- *NP or NPN digital output and 4 - 20 mA analogue output*
- *Teach-in of the measurement limit values for digital output activation*
- *3 setting push-buttons and a 4-digit display*

## S65-Z SERIES

Built in a 50 x 50 mm standard compact housing, the **S65-Z** series offers a retroreflex line sensor for accurate measurements of the centre or edge position and width of objects. This series results to be particular suitable for a wide range of industrial automation applications, such as packaging, printing assembling on automatic machines.

The detection is made on a reflecting tape, supplied with the sensor, positioned behind the object, with a 150 mm maximum measurement field width and a 200 mm operating distance.

The 4-20 mA analogue output is proportional to the measurement, while the digital output, PNP or NPN according to the model, is activated when the measured value is included inside the interval fixed by the operator via teach-in.

An alarm signal is activated when the luminous intensity received is weak, as for example in presence of dirty lenses.

The setting is accomplished through three push-buttons present on the control panel, together with the output status LED, two LEDs signalling the operating mode, an alarm LED and a 4-digit display for the visualisation of the measurement and sensor configuration messages.

Models with the RS485 serial interface offer the remote setting of all the programmable functions as well as the transmission of the measurements to an industrial PC are available. The electrical connection is made through a standard M12 8-pole connector.

# Z LINE SENSOR

The object to measure is illuminated by the infrared emission cone. The light reflected by the reflector is detected by a photodiode array and analysed according to 3 operating modes:

- Edge position: detects the position of the right or left edge of an object or of the first edge beginning from the right or left side in presence of more objects;
- Centre position: detects the centre independently from the object's dimensions;
- Width measurement: in presence of one object it provides the distance between two edges; in presence of different objects it provides the sum of the respective widths;

The analogue output generates a signal proportional to the distance from the reference edge or to the object width; the digital output switches when the detected position or measurement is inside the interval acquired via teach-in.

## DIMENSIONS

## INDICATORS AND SETTINGS

- A** Output status LED
- B** Alarm LED
- C** Operating mode LEDs
- D** 4-digit display
- E** SET push-button
- F** +/- selection push-buttons
- G** M12 connector output orientable on two positions

## ACCESSORIES

For dedicated accessories refer to the **ACCESSORIES** section of this catalogue.

Refer also to **Connectors (A.03)** and **Fixing Brackets (A.04)** of the **General Catalogue**.

## TECHNICAL NOTES

<sup>1</sup> Limit values

<sup>2</sup> Average life of 100.000 h with  $T_A = +25^\circ\text{C}$

<sup>3</sup> Connector can be blocked on two positions

<sup>4</sup> A - reverse polarity protection

B - overload and short-circuit protection

## DETECTION DIAGRAMS

**Note:** the digital output is activated inside the switching range if the inferior limit is acquired first and then the superior limit. The inverse logic functioning is obtained inverting the acquisition order.
